NOTE

- 1.Ripple/Noise measured with 20MHz bandwidth and 1.0uF ceramic capacitor.
- 2.Tested by minimal Vin and constant resistive load.
- 3.Measured Input reflected ripple current with a simulated source inductance of 12uH.
- 4.Exceeding the absolute ratings of the unit could cause damage. It is not allowed for continuous operating.
- 5.Operation under no-load conditions will not damage these devices, however they may not meet all listed specifications.

TEST CONFIGURATIONS

Input Reflected Ripple Current Test Step

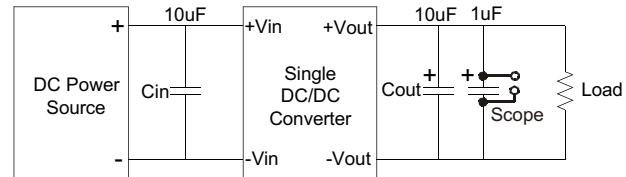

Input reflected ripple current is measured through a source inductor Lin(12uH) and a source capacitor Cin(47uF, ESR<1.0Ω at 100KHz) at nominal input and full load.

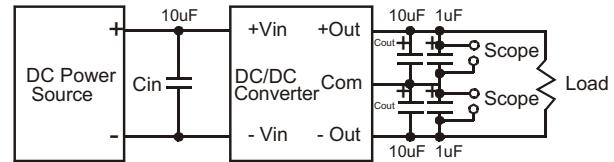

Output Ripple & Noise Measurement Test

To reduce ripple and noise, it is recommended to use a 1uF ceramic disk capacitor and a 10uF electrolytic capacitor to at the output.
